- 2. The following information was obtained on 11 June 1955:
  - a. The completed new type 65 locomotive has been returned to the Karl Mark Locomotive Factory at Babelsberg for major modifications in its design. After completion of this work, the locomotive will again be subjected to tests at the Engine Test Lastitute (NVA) in Halle. The locomotive disappointed designers and it is feared that it is a failure. The utilization of "sodaphos" (sodium phosphate) caused heavy damage to the regulator.
  - b. The newly developed locomotive of type 83 rendered good service up to 800 HP. The maximum output of the locomotive is believed to be around 1,000 HP. The coal consumption of this type locomotive was higher than other locomotives of a comparable category. Moreover, defects on the regulator also occurred with the type 83 locomotive. It was therefore also returned to Babelsberg for elimination of this shortcoming. It was believed that the type 83 locomotive will become a usuable locomotive.
  - c. The feed-water heaters and mixers (Heisswasser Mischvorwaermer) developed for the new type 65 and 83 locatives were dismantled again from these locomotives became ter pump broke down after a short period of service preheater pumps.
  - d. Two locomotives of the 25-series were under development at the Karl Marx Locomotive Factory at Babelsberg. One of the locomotives was designed for coal duet-firing, while the other was to be equipped with a mechanical coal charger.
  - e. The construction of mobile measuring stations was making slow progress. The Central Technical Office of the railroad administration must import precision measuring sets from the West, because the measuring equipment built in the GDR are not up to requirements.
